

USx Tenant Groups

Generated 2026-09-16 09:23 by tool\report_tenant_groups.ps1 from 69 pulled tenant configurations. Repo builds indexed: 21 providers.

What this document is for. Scoping is the blocker: tenant_scope.json ships empty, so every report and every import job still carries tenants already decided against. Mark this up and the exclusions get applied with your reason and the date.

What is measured and what is guessed. Ours / not ours is MEASURED — a configuration of ours carries a Provider configuration for <P> vX.Y stamp in its bundle description, and where the content also hashes equal to the current repo build it is marked CURRENT. Absence of that stamp is *evidence*, not a gap: it is how Lafayette was confirmed hand-built by engineering. **The real-vs-development split in section B is a HEURISTIC** — the only guessed thing here. Each row prints the signal that placed it, so you can correct it by looking rather than by trusting the tool.

Summary

Group	Count	Basis
A — our build	34	MEASURED: carries our version stamp
B1 — not ours, looks like a real tenant	10	measured not-ours; no dev/test signal in the name
B2 — not ours, looks like development / testing	21	measured not-ours; HEURISTIC on name + status
A0 — our tenant, NOTHING installed	4	MEASURED: usx-* in the roster, no configuration present at all
deactivated (not listed)	0	platform status; cannot serve queries

A0. Our tenant, running NOTHING — 4

A usx-* subdomain is ours by construction — the same authority the deploy path uses to resolve a tenant’s intended provider. These carry **no provider bundle at all**, so no config was ever pulled for them and every config-derived report is silent about them by construction. That silence is why this section exists.

Tenant	Dept id	Status	What is installed
usx-ca-contracosta	69586006831	TEST	(no config on this tenant)
usx-ca-san-louis-obispo	69586091660	TEST	(no config on this tenant)
usx-ca-ventura-county	69510611328	TEST	(no config on this tenant)
usx-sc-sled	73046844870	TEST	(no config on this tenant)

Empty is a finding, not a blank. It means no build of ours has ever been deployed there — for a provider test tenant that is the difference between “never tested” and “tested and behind”. Not every row is a defect: several are deliberate holds.

A. Runs a configuration WE created

Measured from the bundle description, corroborated by content hash against the current repo build.

B. Runs a configuration we did NOT create

A provider bundle is present but carries no version stamp of ours — confirmed by content to match no build in our history. Overwriting one of these is a different decision and needs a human.

B1. Looks like a real tenant — 10

Tenant	Dept id	Status	Provider bundle	Bundles present
1836	19930015536	TRAINING	FL_FCIC	FL_FCIC
ccpd	1001142	LIVE	RecordsArchive	ENTITIES, RecordsArchive

lafayettela-sherifftraining	5107052982	TRAINING	LA_LEMS	name matches training

A LIVE tenant is never placed in B2 on its name. Status outranks the name, because a real deployment with an informal subdomain is exactly the row that must not be quietly filed as a test system.

A customer's TRAINING tenant is not a development sandbox. `lafayettela-sherifftraining` is placed in B2 by the word "training", but it belongs to Lafayette Parish — a real agency whose LA_LEMS configuration the ledger already records as hand-built by engineering. Excluding it would hide a supported environment. Judge it with its sibling `lafayettesheriff-1a` in B1, not with the demo tenants.

How to use this

1. Mark the rows that should be **excluded** from import planning and reporting.
2. They move into `tools\config\tenant_scope.json` under `excluded`, each with a reason and a date — never silently dropped: every count prints in-scope and excluded side by side.
3. A tenant on a deliberate HOLD is reported separately rather than excluded, so the hold stays visible instead of quietly becoming a forgotten gap.

Nothing here is applied. No tool writes `tenant_scope.json` or `IMPORT_LEDGER.md`.
